INTRODUCTION

1. DOCUMENT PURPOSE

This document describes the operation activities performed during the Survey measurements. The survey at Matera site was completed during January 2009.

3. ACTIVITIES CARRIED

In the January 2009 a Geodetic Survey was completed at Centro di Geodesia Spaziale (CGS) of Italian Space Agency (ASI) located near Matera (Italy).

This site hosts a complete set of space geodetic techniques that are routinely used: a SLR station, a VLBI station, a fixed GPS receiver.

The Geodetic Survey controlled the Matera Laser Ranging Observatory (MLRO) telescope reference point and the MLRO calibration piers as parts of the local survey control network.

The measurements were performed by F. Ambrico with the support of the Matera CGS operational team. The data analysis were performed by R. Lanotte.

3.1. SITE DESCRIPTION

The CGS site is situated at about 15 km east of Matera town.

Geographic Region:	MEDITERRANEAN
Tectonic Plate:	EURASIAN
Geological Province:	SOUTHERN APPENNINES
Local Geology:	UPPER CRETACEOUS SEDIMENTS
Site Name; IGS Number:	MATERA; 850
Domes Number IERS :	12734

Fig 1 shows the lay-out of the station site, including the SLR-MLRO System, two SLR universal pads, the VLBI antenna, the GPS Antenna.

The reference point "M" is the intersection of the azimuth and elevation axis of the fixed MLRO telescope.

The old SLR-SAO System (marker "O") was closed at the end of 2000 and it is not considered in this survey.

Domes Number IERS	CDP n.	Description
12734-S001	7939 (4101)	SLR SAO (old system)
-S008	7941 (7701)	SLR-MLRO System "M"
-S005	7243	Fixed VLBI antenna
-M008		GPS MATE reference Marker "R"
-M009		GPS/Glonass MAT1 reference Marker "N"
-M004	7541	Marker SLR 7541 "C"
-M005	7540	Marker SLR 7540 "B"

M1, M2, M3, M4 and M5 are the external calibration piers for the MLRO system.

The markers H and K are located on the basement of the VLBI antenna.

The marker "P" is the IGM (Istituto Geografico Militare) reference point.

The marker "V" is the gravimeter reference point located in ASI Main Building room N° 34, on the gravimeter basement.

The points "A", "E", "G", "L", "U", "X", "Y", "Z", are additional reference points for reconstruction of all previous markers.

Fig. 2 shows the telescope and the corner cube mounted on the pedestal.

Fig. 3 , shows the GPS antenna and its reference point.

Fig. 4 shows the calibration pillar "T".

Fig. 5 shows the calibration pillars M1, M2, M3, M4, M5.

Fig. 6 shows the IGM pillar "P".

Fig. 7 shows the corner cube mounted respectively on M, M1, M2, M3, M4, M5, T used as target for measure

4. SURVEY MEASUREMENTS PROCEDURES

The theodolite used for the survey is a TACHYMAT WILD TC2002S with angle measurement accuracy of 1" and distance measurement accuracy of $\pm (2\text{mm} + 2\text{ppm})$.

The measurements were made in six different configurations moving the survey equipment all over the following markers of the local network; "M1", "M2", "M3", "M5", "P", "T".

For each station, horizontal and vertical angle and distance measurements were taken to the prism reflector mounted over all the other markers.

In order to measure point "M", the intersection of the azimuth and elevation axis of the MLRO Telescope, the following steps were made:

- Tilt the telescope of 180 degrees;
- Level telescope using a level;
- Install a corner cube prism on the top of the telescope above the centre of the vertical axis.

Measurements were also corrected by 940 mm that is the offset height given by manufacturer (Fig 2)

5. SURVEY DATA PROCESSING

The data have been analyzed using the software GSMAT developed by Telespazio. The computation and analysis consist of following steps:

1. Distances are corrected for atmospheric refraction using the "Barrel and Sears" formula and meteo data (temperature, pressure and humidity) continuously recorded by the meteorological sensors operating at ASI/CGS and stored in the GEODAF web server.
2. Correction for the height differences between the instruments (tachometer and reflectors) and the markers.
3. For each setup of the theodolite, vectors are transformed from the topocentric polar reference system (azimuth elevation distance) in a topocentric rectangular reference system (up, east north) centered in the marker occupied by the theodolite and having a unknown orientation angle w.r.t. the astronomical azimuth.
4. Determination of the unknown orientation angles using the Polaris star to orientate the network w.r.t. the geographical north direction.
5. Minimal inner constraints solution via Singular Value Decomposition to solve for marker coordinates in an unique topocentric rectangular reference system using the whole covariance matrix at each step of the computation.
6. Outlier detection. If outlier are detected, they are automatically removed and computation is repeated.
7. Translation of the network to the position of the GPS marker R as in the ITRF2000 to obtain the coordinates of the network points in the ITRF2000 terrestrial reference system.

The a priori input errors are the following:

- Azimuth: 0.3 milligrades = 1 masec
- Elevation: 0.3 milligrades = 1 masec
- Distance: 1 mm
- Height Differences: 1 mm

At the end of the outlier detection/removal process a total of 166 triple observables have been used in the analysis. The number of triples for each marker is reported in the following table

Marker	
C	8
K	16
M	25
M1	37
M2	28
M3	52
M4	25
M5	42
P	29
R	21
T	45
V	4

6. SURVEY DATA RESULTS

Il The Minimal inner constraints solution provides the network coordinates in a local topocentric reference frame that is oriented correctly with respect to the astronomical north but centered in a particular point determined minimizing the trace of the variance-covariance matrix of the parameters.

8. ASTRONOMICAL AZIMUTH ORIENTATION

The astronomical azimuth orientation of the network has been determined by observations of the Polaris star, from the monument "P" (18 March 2004).

The software package used for data processing has been developed by G. Bianco (ASI).

Table 6.1 summarises the results of these observations.

Marker "C" and "M3" have been used as terrestrial references.

The column marker "C" and "M3" show the azimuth values (grades) of these reference points with respect to the astronomical north, taking into account the anomaly of the star.

These measurements are in agreement with the previous report: Survey of the Matera Site March 2000.

ASTRONOMICAL AZIMUTH DETERMINATION

STATION:	MATERA MARKER "P"
OBSERVER:	F. AMBRICO
TERR.DIRECT:	MARKER "M3" and "C".
OBSERVED STAR:	POLARIS 907
DATE:	18 March 2004
LAT:	40° 38' 56.87"
LON:	16° 42' 16.05"

18 March 2004

UT	MARKER "M3"	MARKER "C"
18:44	200.9480	152.4237
18:48	200.9478	152.4244
18:56	200.9471	152.4246
19:07	200.9475	152.4248
19:20	200.9470	152.4243
19:30	200.9469	152.4242
AVER.=	200.9474	152.4243

The previous value on marker C (survey 2000) was: 152.4254.
